

# DTT55-s

## Two-part Curable Thermal Grease (for immersion cooling systems)

LiPOLY DTT55-s is a high-reliability, curable thermal interface material designed for long-term stable operation of high-power AI chips in immersion cooling environments, with proven compatibility for prolonged exposure to cooling fluids. After application and curing, it forms a structurally stable, high-thermal-conductivity interface layer between chips (such as GPUs, AI accelerators, and ASICs) and cold plates or other heat dissipation structures, delivering low interfacial thermal resistance and reliable heat transfer. Compared with non-curable TIMs, DTT55-s effectively prevents material loss, displacement, and performance degradation during long-term immersion, ensuring stable thermal performance under continuous high heat flux, extended operation, and fluid-induced stress in immersion-cooled AI servers.

### ■ FEATURES

- / Thermal Conductivity: 5.0 W/m\*K, high thermal performance, low thermal resistance
- / Cured Structure: Liquid-phase gap filling for easy assembly; thermally cured for high structural stability under long-term fluid flow and thermal cycling.
- / Immersion Compatible: Non-soluble, non-swelling, no contaminant leaching
- / High Reliability: Stable thermal performance under prolonged high-temperature operation.

### ■ TYPICAL APPLICATION

- / AI GPU modules (NVIDIA / AMD / in-house ASICs)
- / AI immersion-cooled servers
- / High-power accelerator cards (OAM, HGX, custom modules)
- / Liquid cooling / hybrid immersion cooling systems
- / High-performance computing (HPC) systems
- / Industrial servers / edge computing platforms
- / Power modules / power electronics cooling
- / Telecom / 5G high-density compute modules
- / EV / green energy high-power electronic modules

### ■ CONFIGURATIONS

- / Cartridges: 50ml, 400ml
- / Other special and custom sizes are available upon request

### ■ DISPENSING INSTRUCTIONS

Use the disposable plastic static mixing nozzles to mix parts A and B together to the desired ratio. Liquid gap fillers can be dispensed using an automatic dispensing machine or a manual dispensing tool that can be provided by LiPOLY upon request/purchase. The disposable plastic static mixing nozzles cannot be re-used.

### ■ STORAGE

Two-part liquid gap fillers should be stored in climate-controlled environments at or below 30°C. Keep liquid gap fillers away from direct sunlight and away from high-temperature environments.

### ■ PRESERVATION

It can be preserved for 24 months under the condition of unopened and under room temperature 30°C. (Note: The product may experience oil-powder separation after being stored for an extended period, which is a natural sedimentation phenomenon caused by the density difference between silicone oil and powder. This does not affect its functionality and can be used as normal. It is recommended to stir the product evenly before use. )

## ■ PRECAUTIONS

The two-part liquid gap filler may not cure properly if it comes into contact with certain substances, including amine, sulfur, organophosphorus compounds, and organotin compounds. Please avoid the following substances when handling: (N, P, S, Sn, Pb, Hg, Sb, Bi, As) Ensure a clean mixing container is used (e.g.: paper cup or plastic cup) before injecting the A and B parts into the mixing container. The plasticizer, wax from the cups, varnish or the epoxy from the oven may contaminate the A and B parts. You are reminded to pre-test the gap filler before using it.

## ■ PLEASE NOTE

It's recommended that the diameter of mixing tube outlet should be 3mm at least, which can solve the possible problem of poor fluidity caused by ambient temperature.

## ■ TYPICAL PROPERTIES

| PROPERTY                 | DTT55-s                         | TEST METHOD | UNIT              |
|--------------------------|---------------------------------|-------------|-------------------|
